Abstract

A system for generating structured information reports includes a parameter obtaining module (1201) for obtaining data input by a user; a downloading module (1202) for downloading data from a remote database server; a variable defining module (1203) for defining variables of the report; a column generating module (1204) for generating columns/rows of the report; and a report generating module (1205) for adding the downloaded data to the report. A method for generating structured information reports includes the steps of: obtaining downloading parameters; downloading data from a remote database server, and storing the data in a local database server; obtaining attribute data on analyzing the data stored in the local database server; defining variables of a report in accordance with the attribute data; generating columns/rows of the report in accordance with the defined variables, and adding the downloaded data to the report.
